In a single stage compressor the air is compressed from atmospheric pressure to 100 pounds in one cylinder and reaches the receiver at 482 Fahr. NOTE.--Radiation and cooling influence of water jacket not considered. Fig. 1341.--Compression curves. If the heat of compression be removed as fast as generated, and the compression proceed under a uniform temperature, it is said to be isothermal and the compression curve follows the line A B C in the diagram. If the isothermal compression of air were practicable, and if the heat absorbed from the air by the cooling agent could be applied to the air during its re-expansion in use along a similar isothermal curve, the result would be perfect thermo-dynamic efficiency, and it is toward an approximate realization of these ideal conditions that the best compressor practice is directed. The line ADE in the diagram represents the other extreme, or adiabatic compression, during which no heat is removed from the air, and in consequence of which the temperature rises. Since a given weight of air at a given pressure occupies a volume proportional to its absolute temperature, the volumes at all pressures are greater in adiabatic than in isothermal compression in a ratio increasing with the pressure, and since the work of compression and discharge is represented by the area in the diagram to the right of the curve along which compression is accomplished, it will be seen that the area A...
